# A Source Program in C++: High Level Abstraction

```
#include <iostream>
using namespace std;

int main()
{
    int n, fact=1;

    cout << "Enter the number: ";
    cin >> n;
    for (int i=n; i > 0; i--)
        fact = fact * i;

    cout << "The factorial of " << n << " is " << fact << endl;

    return 0;
}
```

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

# Commands to Obtain the Low Level Abstraction

- Write the program and name the file `fact-iterative.cc`
- `g++ fact-iterative.cc` produces the executable in `a.out` file
- `strip a.out` removes names from the executable `a.out`
- `file a.out` produces the following output

```
a.out:  ELF 64-bit LSB shared object, x86-64, version 1
(SYSV), dynamically linked, interpreter
/lib64/ld-linux-x86-64.so.2,
BuildID[sha1]=0c218bf025a20bc43339dfd15cec41adc1c13946, for
GNU/Linux 3.2.0, stripped
```
- `objdump -d a.out` produces the hexadecimal form along with assembly program

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- Computing was a black art
- Things available:  
The problem, the machine, the manual, and individual creativity
- *“Computers were pretty crazy things. They had very primitive instructions and extremely bizarre input-output facilities.”*
- Example: Selective Sequence Electronic Calculator (SSEC), 1948 - 1952  
Store of 150 words, Vacuum tubes and electro-mechanical relays

Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

## Octal Humour

- *“Why can’t programmers tell the difference between Christmas and New Year’s Eve? Because 25 in decimal is 31 in octal.”*
- *“We programmed it in octal. Thinking I was still a mathematician, I taught myself to add, subtract, and multiply, and even divide in octal. I was really good, until the end of the month, and then my check book didn’t balance! It stayed out of balance for three months until I got hold of my brother who was a banker. After several evenings of work he informed me that at intervals I had subtracted in octal. And I faced the major problem of living in two different worlds.”*

*“That may have been one of the things that sent me to get rid of octal as far as possible.”*

— Grace Hopper

# The Priesthood of Computing

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- *"Programming in the America of the 1950s had a vital frontier enthusiasm virtually untainted by either the scholarship or the stuffiness of academia."*
- *"Programmer inventors of the early 1950s were too impatient to hoard an idea until it could be fully developed and a paper written. They wanted to convince others. Action, progress, and outdoing one's rivals were more important than mere authorship of a paper."*
- *"An idea was the property of anyone who could use it and the scholarly practice of noting references to sources and related work was almost universally unknown or unpractised."*

# Obstacles in Creation of a High Level Language

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- Priesthood wanted to preserve the order

*“Priesthood wanted and got simple mechanical aids for the clerical drudgery which burdened them, but they regarded with hostility and derision more ambitious plans to make programming accessible to a larger population. To them, it was obviously a foolish and arrogant dream to imagine that any mechanical process could possibly perform the mysterious feats of invention required to write an efficient program.”*

- Priesthood wanted to preserve the order  
*“Priesthood wanted and got simple mechanical aids for the clerical drudgery which burdened them, but they regarded with hostility and derision more ambitious plans to make programming accessible to a larger population. To them, it was obviously a foolish and arrogant dream to imagine that any mechanical process could possibly perform the mysterious feats of invention required to write an efficient program.”*
- There also were purveyors of snake oil  
*“The energetic public relations efforts of some visionaries spread the word that their “automatic programming” systems had almost human abilities to understand the language and needs of the user; whereas closer inspection of these same systems would often reveal a complex, exception-ridden performer of clerical tasks which was both difficult to use and inefficient.”*

# The A2 Compiler

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- Adding instructions to the machine viz. floating point operations
  - Programmers had a library of subroutine
  - They needed to copy the subroutine on the coding sheets by hand and change addresses manually
- Grace Hopper added a “call” operation whereby
  - the machine would copy the code
  - and update the addresses

Compiler

Modern Challenges

Conclusions

- Adding instructions to the machine viz. floating point operations
  - Programmers had a library of subroutine
  - They needed to copy the subroutine on the coding sheets by hand and change addresses manually
- Grace Hopper added a “call” operation whereby
  - the machine would copy the code
  - and update the addresses

Later called a *linker*

Later called a *relocatable loader*

- Grace Hopper added a “call” operation whereby
  - the machine would copy the code Later called a *linker*
  - and update the addresses Later called a *relocatable loader*

The name “Compiler” was used because it put together a set of subroutines

# The “Real” High Level Languages

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- Conrad Zuse's Plankalkul developed in a small village in Germany (1945)
  - “Program Calculus”
  - Only design, no implementation  
(Computers were destroyed in world war II)
- Laning and Zierler's language for the WHIRLWIND at MIT (1953)
  - Fully algebraic in terms of supporting expressions
  - Very inefficient

# Challenges for Creation of High Level Languages

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- The tyranny of OR  
Expressiveness OR Efficiency
- Expressiveness:  
Higher level abstraction, features not supported by hardware
- Most time was spent in floating point subroutines
  - Not much attention was paid to address calculation, good use of registers

# Challenges for Creation of High Level Languages

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- The tyranny of OR  
Expressiveness OR Efficiency
- Expressiveness:  
Higher level abstraction, features not supported by hardware
- Most time was spent in floating point subroutines
  - Not much attention was paid to address calculation, good use of registers
- IBM 704 directly supported fast floating point operations
  - The need of expressiveness vanished revealing inefficiencies  
Clumsy treatment of loops, indexing, references to registers
  - Led to rejection of “automatic programming”

# The Genius of John Backus

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

He made the following important observations

- The main reason of inefficiency was a clumsy treatment of loops and array address computations  
If that could be handled, things may be far different
- The possibility made a lot of economic sense
- Language implementation was far more critical than language design

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

# The Genesis of FORTRAN

- Motivation:

Programming and debugging costs already exceeded the cost of running a program, and as computers became faster and cheaper this imbalance would become more and more intolerable

- Goals: Can a machine translate

- a sufficiently rich mathematical language into
- a sufficiently economical program at
- a sufficiently low cost

to make the whole affair feasible?

*The generated programs needed to be comparable to hand coded programs in efficiency*

Uday Khedker  
IIT Bombay

Uday Khedker  
IIT Bombay

Talk Title:  
History of Compiling

Topic:  
Outline

What is a Compiler?

The Birth of a  
Compiler

Modern Challenges

Conclusions

- No reserved words
- Tokenization ignored spaces
- Simplistic functions
- No subprograms, no recursion
- No spaces
- DO loops with limited nesting depth of 3
- Implicit types based on the first letter
- No declarations required

## Minor Errors Could be Rather Expensive

- The first American Venus probe was lost because of a computer problem
- A programmer replaced a comma by a dot

Should have been	Was
DO 10 I = 1, 3	DO 10 I = 1. 3

- What was essentially a DO loop header got treated as an assignment statement `DO10I = 1.3` by the compiler

## FORTRAN Rules for Expressions

1. Any fixed point (floating point) constant, variable, or subscripted variable is an expression of the same mode. Thus  $3$  and  $I$  are fixed point expressions, and  $ALPHA$  and  $A(I, J, K)$  are floating point expressions.
2. If  $SOMEF$  is some function of  $n$  variables, and if  $E, F, \dots, H$  are a set of  $n$  expressions of the correct modes for  $SOMEF$ , then  $SOMEF(E, F, \dots, H)$  is an expression of the same mode as  $SOMEF$ .
3. If  $E$  is an expression, and if its first character is not “+” or “-”, then  $+E$  and  $-E$  are expressions of the same mode as  $E$ . Thus  $-A$  is an expression, but  $--A$  is not.
4. If  $E$  is an expression, then  $(E)$  is an expression of the same mode as  $E$ . Thus  $(A)$ ,  $((A))$ ,  $((((A))))$ , etc. are expressions.
5. If  $E$  and  $F$  are expressions of the same mode, and if the first character of  $F$  is not  $+$  or  $-$ , then  $E + F$ ,  $E - F$ ,  $E * F$ ,  $E / F$  are expressions of the same mode.

## FORTRAN Expression Handling

- Conventional precedences were used and parenthesis were not required.
- Simple rule of reconstructing parenthesized expressions:

Assuming three levels of precedences of “+”, “\*”, and “\*\*”

- Add “(((” in the beginning of the expression  
(and hence before every “(” in the expression)
- Add “)))” at the end of the expression  
(and hence after every “)” in the expression)
- Replace every “+” by “))) + (((”
- Replace every “\*” by “)) \* ((”
- Replace every “\*\*” by “) \* \*(”

Conclusions

## On compiler reliability

- Tables stored on the magnetic drum based memory
- Slow searches and more load on drums
- The compiler worked far better at GM than at Westinghouse
- GM people had ensured a much better servicing of magnetic drums!

## FORTRAN Compiler Anecdotes (3)

### On compiler efficiency

- Frank Engel at Westinghouse observed that tapes moved independently but sequentially
- Compiler could become faster if tape movement is made to overlap
- Frank asked for the source and got a reply: (source meant assembly)  
*"IBM does not supply source code"*
- Frank patched up the octal object code of the compiler and the throughput increased by a factor of 3!
- IBM was surprised and wanted a copy, so Frank said:  
*"Westinghouse does not supply object code"*

Modern Challenges

Conclusions

# Modern Challenges: New Expectations

- New application domains bringing new challenges
- What are the underlying abstractions of the domains that should become first class citizens in a programming language?
  - Language design and compilers for machine learning algorithms?
  - Language design and compilers for streaming applications?
- Can machine learning algorithms help compilers create new optimizations?
  - Can human ingenuity in design of novel algorithms be replaced by machine learning?  
Need explainability for guaranteeing soundness of new optimizations  
Known cost based optimizations have a better chance with machine learning
  - Can compilers learn from the programs they have compiled and become “better” over time?
